

**AMENDMENTS TO THE CLAIMS**

**This listing of claims will replace all prior versions and listings of claims in the application:**

**LISTING OF CLAIMS:**

1. (currently amended): An image display device which comprises an image display panel, in which two or more groups of particles having different colors and different charge characteristics are sealed in a plurality of cells formed by partition walls between two substrates, at least one of two substrates being transparent, and, in which the particles, to which an electrostatic field produced by electrodes provided to both of the substrates is applied, are made to move so as to display an image, ~~wherein characterized in that~~ a coating area of the electrode provided on two substrates respectively is patternized with respect to a projected area of respective cells.

2. (original): The image display device according to claim 1, wherein at least one of the electrodes provided on the two substrates respectively has a coating area in respective cells of 5 - 99 % with respect to a projected area of respective cells.

3. (original): The image display device according to claim 1, wherein at least one of the electrodes provided on the two substrates respectively has a coating area in respective cells of 30 - 90 % with respect to a projected area of respective cells.

4. (original): The image display device according to claim 2 or 3, wherein a contact dimension between at least one of the electrodes provided on the two substrates respectively and the partition wall is less than 50 % of an inner peripheral dimension of respective cells.

5. (currently amended): An image display device which comprises an image display panel, in which two or more groups of particles having different colors and different charge

characteristics are sealed in a plurality of cells formed by partition walls between two substrates, at least one of two substrates being transparent, and, in which the particles, to which an electrostatic field produced by electrodes provided to both of the substrates is applied, are made to move so as to display an image, ~~wherein characterized in that~~, in the case of arranging the image display panel vertically in a stationary manner, the electrode is patternized in such a manner that no electrode portion is formed at a vertically lower portion in respective cells.

6. (original): The image display device according to claim 5, wherein an area of the no electrode portion formed at a vertically lower portion in respective cells is 5 - 50 % with respect to a projected area of respective cells.

7. (original): The image display device according to claim 5, wherein an area of the no electrode portion formed at a vertically lower portion in respective cells is 15 - 45 % with respect to a projected area of respective cells.

8. (new): The image display device according to claim 1, wherein the coating area of the electrode provided on two substrates respectively is patternized in such a manner as to prevent uneven distribution of the particles to a portion of the partition walls formed around the plurality of cells after application of the electrostatic field produced by the electrodes to the particles.

9. (new): The image display device according to claim 1, wherein the coating area of the electrode provided on two substrates respectively is patternized in such a manner as to prevent production of agglutination members at a portion of the partition walls formed around the plurality of cells after application of the electrostatic field produced by the electrodes to the particles.

10. (new): The image display device according to claim 1, wherein the coating area of the electrode provided on two substrates respectively is patternized in such a manner as to

prevent particle drop at center portions of the plurality of cells after application of the electrostatic field produced by the electrodes to the particles.
